

Classic Oval Bull feeder S6C4 is a great tool in combatting the Drought in NSW

WasteNot Stockfeeders have been supplying Stud Cattle breeders for over 30 years and have enjoyed a great relationship with many of our customers, who continue to educate us in the art and science of feeding cattle.

Just before the National Field days at Orange, we visited Millah Murrah Angus to see how they were coping with the drought in NSW.

Ross & Dimity Thompson have used their S6C4 Heavy Duty Oval Bull Feeders continually since early 2017. They kindly volunteered this testimonial on how well the feeders have fitted into their drought feeding regime.

We purchased 30 WasteNot Feeders early in 2017 as part of a larger investment in a full cattle drought feeding system.

Our standard ration is to mix hay and silage in a vertical mixer, which is then conveyed into the WasteNot Feeders. It is not possible to do this with conventional ring hay feeders.

The cattle eat the mix with their heads over the feeder, with virtually nil wastage. Similarly, when feeding whole bales of hay or silage in the WasteNot Feeders, we estimate wastage at less than 5%. This compares with an estimated wastage of 20% using the previous hay feeders. At \$150/bale the cost savings quickly add up. After the Feeders have been used for 60-70 half tonne bales, we have paid for the feeder in wastage savings.

Longevity of the feeders is very good. Across the 30 feeders we have fed 2000 tonnes so far, with minimal damage.

Handling and erection of the feeders is simple, as is dismantling and storage.

Post-sale service is excellent.

WasteNot Feeders have made our life easier!

We highly recommend the WasteNot Feeder

...Ross & Dimity Thompson Millah Murrah Angus

It is pleasing that Ross and Dimity have confirmed what we have been saying since 1988, that the feeding goes on in the feeders, and there is minimal wastage. They have also attested to the durability of the feeders.
